ANNUAL NIGHT CHART

Galactic Centre observing time

Each vertical trace is a usable core-viewing interval. Dates run left to right; local night time runs downward from 6 pm to 6 am.

Only intervals that pass astronomical darkness, Moon and core-altitude constraints are shown.

REFERENCE

Using this field edition

Time and place

All displayed dates and times are local to Southern Tasmania, Australia. Overnight intervals begin on the printed date and may end after midnight on the following civil date.

Ratings

Ratings combine the edition's established visibility thresholds. The text label is authoritative in monochrome printing; colour is never required to interpret a rating.

Low-Moon darkness

Intervals occur within astronomical darkness and apply the edition's Moon constraint. They are not interchangeable with Galactic Centre visibility, which additionally requires the core to clear the altitude threshold.

Complete reference data

The web edition contains complete CSV tables for twilight, Moon, Galactic Centre, planets, satellites, minor planets, comets and events. This PDF intentionally keeps only field-useful summaries.

Sources and scope

- Solar, lunar, planetary and Galactic Centre circumstances are calculated for the named observing horizon.
- Jupiter and Saturn satellite positions use cached NASA JPL Horizons results in the corresponding web edition.
- Meteor and event entries retain the edition's source notes and validation state in the downloadable data.
- Weather, cloud, smoke, local obstruction and artificial sky brightness are outside the scope of this almanac.
